HEAVY DUTY PALLET RACKING SYSTEM

Space Magnum introduced new concept for Heavy duty racking storage system which is easy to assemble, dismantle and shift to other place without much efforts. In this type of racking system adjustment of level is easier & future expansion both vertically & horizontally. It is very affordable as compared to other racking systems. Pallet racking system provides 100% selective storage as per the handling equipment available in height.

DRIVE IN RACKING STORAGE SYSTEM

Drive in racking offers a high density of pallet storage with low selectivity. Consequently, it is ideal for product with a high number of pallets per SKU. The trucks drive into the racking to load or retrieve pallets, which are stored on cantilevered rails running throughout the system. The first pallet

in is last one out FILO (First In Last Out) unless a Drive- Through system is used whereby pallets can be loaded or retrieved from either side.

CANTILIVER RACKING STORAGE SYSTEM

Cantilever racking is specially designed to store or display material that are too long or too heavy for other racking systems e.g. Pallet racking. The design of cantilever is based on a single load bearing upright that allows for a greater level of flexibility, so material can be seamlessly stored, tallied & retrieved. For heavy duty use cantilever racking is engineered and built to hold a certain load. Cantilever rack can suit retail, commercial and industrial storage requirements and can be categorized

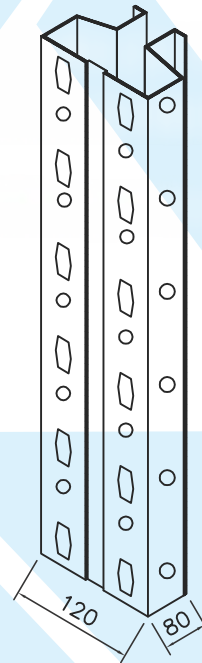

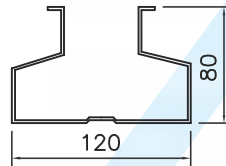

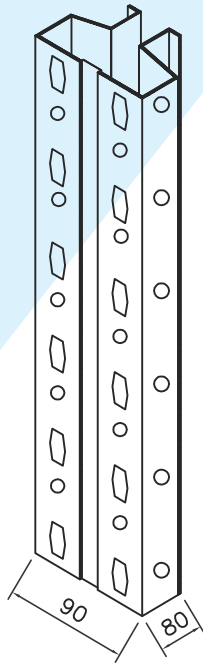

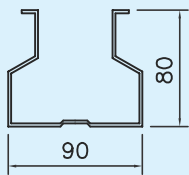

into three main types: heavy duty cantilever racks, medium duty cantilever racks, light duty cantilever racks. Long length materials like pipes, shafts, angles, M.S Sheets etc ideal for storage. Secondly material like coils, wires coils can be stored with ease. For small component storage decking panel facility can be provided in this same cantilever rack.

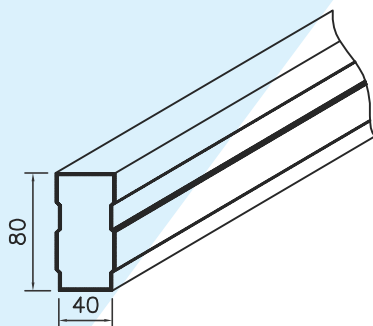

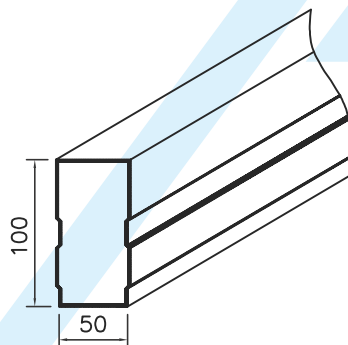

UPRIGHT SECTION RANGE

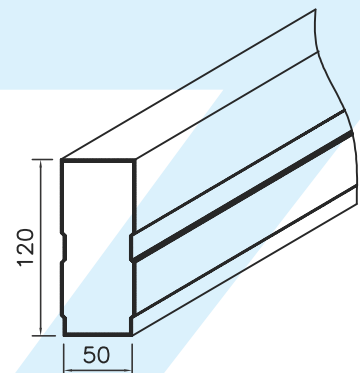

BEAM SECTION RANGE

BEAM SECTION 80x40

BEAM SECTION 100x50

BEAM SECTION 120x50
